Lee Young-jun

Senior iOS Developer · Mobile SDK

kofggm@gmail.com · LinkedIn · GitHub · Portfolio · Medium

I'm an iOS-focused mobile engineer who has owned crash resolution, performance optimization, and CI/CD across multiple domains and platforms. I've worked on both sides of the SDK relationship — maintaining and extending an internal iOS SDK consumed by multiple apps, and integrating third-party SDKs into production apps — which shapes how I think about API design, versioning, and developer experience. I dig into unfamiliar tools to find efficiency gains, give direct feedback on specs and API design to help ship better products, and treat AI coding agents as collaborators whose output I critically verify.

iOS 5+ yrs (Mobile 8+ yrs · Total experience 15+ yrs)

Experience

SK AX (Contract via D2L)

2024.06–2025.10 · Freelance · iOS Developer

SK Group IT outsourcing · sole maintainer of 3 SKT iOS projects (SWING, T world, AI Layer SDK)

- Diagnosed and **root-caused 5,000+ weekly crashes** in T world traced to a force-unwrapped delegate parameter, resolving the issue after the original proposed fix failed to reproduce the crash; implemented a request queue to reduce server load under high concurrent traffic
- Maintained and extended an internal **AI Layer iOS SDK** consumed by two SKT apps, including accessibility/UI improvements and MR template setup for the SDK team
- Implemented a Combine-based AI recommendation tooltip/nudge UI, wiring the view model to the view reactively
- Built a SwiftUI WidgetKit widget for T world (UIKit elsewhere), resolving a security-setting conflict via **shared app–widget Cookie Storage**
- Established **Unit Test** authoring as standard process for new API additions
- Restructured unreviewable large MRs into subtask-level MRs with an **MR template** and a Jira Epic/Task/Subtask structure, enabling delegation to junior engineers; adopted by other projects after manager approval
- Automated build → **TestFlight** → Slack IPA delivery with **Fastlane** in an environment without GitLab CI execution permissions
- Coached **2 junior engineers**

Olulo (Kickgoing)

2021.06–2023.10 · Full-time · App Dev → Tech Lead

Korea's first shared e-scooter service · React Native (cross-platform); mobile experience, not native iOS

- Reduced zone-info API calls from **4 to 1** by caching location data, cutting data usage by **at least 75%**
- Added zoom-level calculation logic directly to the **Naver Map SDK**'s **native bridge** (Java/Objective-C) to auto-fit full routes on screen for turn-by-turn navigation
- Consolidated separately managed iOS/Android GitHub CI/CD workflows into a single **Fastlane**-based pipeline; changed Android delivery from S3-link sharing to **direct Slack upload**; cut deployment time by **50%** via build caching
- Optimized BLE scan/connect flow, validated with measured latency improvements
- Integrated a third-party CX SDK (**Channel Talk**) to move phone-only customer support in-app; **root-caused a crash** in the SDK's notification-handling path, reported it through the vendor's own in-app support channel, and submitted an upstream fix — their team **shipped a fix within a week** after looping in an engineer directly
- Led **2–3 engineers**; introduced a recurring tech-debt time slot that drove work including a React Native 0.71 upgrade
- Ran a **monthly mobile engineering meeting** to share knowledge across the team and assign ownership of framework/OS-level upgrades
- Introduced a PR template and standardized Jira workflow to improve code review and process consistency

SJW International (Siwonschool)

2018.06–2021.05 · Full-time · iOS Developer

Korea's leading online language education platform

- Took over a stalled project, redefined the plan from scratch, and built the app solo working directly with backend engineers; raised App Store rating from **4.1 to 4.7** via a self-designed in-app review prompt
- Adopted MVVM with RxSwift; built a shared **CocoaPods video player library** consumed across multiple apps
- Built an **XCUITest**-based QA process that traversed all lecture content during idle time to detect playback failures the responsible team hadn't been able to reproduce
- Found and fixed memory leaks using **Instruments** (Memory Graph / retain cycle analysis)
- Built **Fastlane**-based CI/CD from scratch
- Delivered a standalone iOS version of a vocabulary app (VicTOEIC) with self-proposed **StoreKit** in-app purchases

Swift MVVM RxSwift AVFoundation XCUITest Instruments Fastlane StoreKit CocoaPods

Independent iOS Developer

2017.02–2018.06 · Solo Developer

- Planned, built, and shipped multiple personal iOS apps solo, including a stock-search app with a self-built **Node.js** backend that **doubled revenue**, and a game-utility app with 500+ daily users
- Built a serverless remote data source using **Google Drive Xlsx** for a content-update-only app
- Contributed to **ShowNote**, an iPad PDF presentation app whose post-departure development led to a filed patent and **KRW 1B investment**

Swift UIKit CocoaPods Firebase PDF Rendering Node.js Google Drive API

CREDiF

2009.08–2017.02 · Full-time · Developer

SI/SM for Korea's telecom carriers and public institutions

- Full-stack development and maintenance across **30+ projects**, from server (C) to client (C#/Java) and mobile (iOS/Android), often stepping in during staffing gaps or incidents
- Led client development for an R&D center's IBS/FMS systems; rebuilt a national genome cloud storage client cross-platform

C C# Java WPF Delphi Python MySQL Oracle MSSQL PostgreSQL

AI-Assisted Engineering

- Built an **Ollama**-based, agent-driven MR review pipeline on a self-hosted GitLab Runner under security constraints at SK AX, helping a non-developer manager meet an AI-adoption KPI while giving the team faster, safer review coverage
- Built a **SwiftUI migration automation skill** (opencode/Codex-based, refined with Claude Code) for a personal app, cutting migration time per app from 1+ week to **1–2 days**

External Activities

- Applied Tuist to modularize personal iOS projects (personal projects only); wrote up the experience and connected directly with Tuist's creator, Pedro Piñera; contributed a Korean translation of Tuist's docs and runs a Korean Tuist community
- Presented "Accelerating Build Iteration with Tuist Cache, Selective Testing, and Easy CI" at Seoul iOS Meetup
- Explored **TCA (The Composable Architecture)** in an unpublished personal project (Settings, Modals, SwiftData integration), documented in a Medium article series
- Regular participant in Dev Korea Meetup; publishes iOS and React Native technical articles on Medium

---

Education

Seoil University

2003.03 – 2009.02 · B.S., Software Engineering (3-year program)
